

Find and fix the bug from below code

```
1 function printName() {  
  if (true) {  
    var name = "Akshay";  
  }  
  console.log(name);  
}  
printName();
```

The screenshot shows the VS Code interface with the 'Debug Console' tab selected. The command `/usr/bin/node ./index.js` has been executed, and the output `Akshay` is displayed in blue text. The 'Problems' and 'Output' tabs are also visible at the top of the console panel.

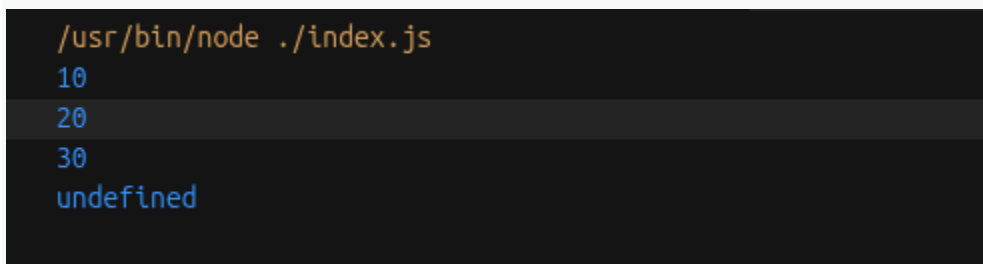

```
2  
let age = "18";  
if (age === 18) {  
  console.log("Adult");  
} else {  
  console.log("Minor");  
}
```

The screenshot shows the VS Code interface with the 'Debug Console' tab selected. It displays the command `/usr/bin/node ./index.js` and a message `Minor` in blue text, indicating a minor error.

3.

```
const arr = [10, 20, 30];  
for (let i = 0; i <= arr.length; i++) {  
  console.log(arr[i]);  
}
```

The screenshot shows the VS Code interface with the 'Debug Console' tab selected. It displays the command `/usr/bin/node ./index.js` and the output of the code: `10`, `20`, `30`, and `undefined` in blue text.

Explanation:

Here for loop is executing 4 times and array contains only 3 elements so it gives undefined

Below is corrected code:

```
const arr = [10, 20, 30];  
for (let i = 0; i < arr.length; i++) {  
  console.log(arr[i]);  
}
```

```
/usr/bin/node ./index.js  
10  
20  
30
```

```
4.let data;  
setTimeout(() => {  
    data = "Loaded";  
}, 1000);  
  
console.log(data);
```

```
/usr/bin/node ./index.js  
undefined
```

Explanation:

A variable data is created, but no value is assigned to it. After that setTimeout() is called for 1 sec. So JS code runs synchronously. So console.log() executes immediately. A variable data is empty so prints undefined.

Below is improved code

```
let data;  
setTimeout(() => {  
    data = "Loaded";  
    console.log(data);  
}, 1000);
```

```
/usr/bin/node ./index.js  
Loaded
```

Note:- loaded will print after 1 sec

5.

```
function add(a, b) {
```

```
  a + b;
```

```
}
```

```
const result = add(2, 3);
```

```
console.log(result);
```

```
/usr/bin/node ./index.js  
undefined
```

The function receives $a = 2$ and $b = 3$.

It calculates $a + b$, but does not return it.

Because nothing is returned, the function gives back undefined.
result becomes undefined. console.log(result) prints undefined.

Below is improved one:

```
function add(a, b) {
```

```
  return a + b;
```

```
}
```

```
const result = add(2, 3);  
console.log(result);
```

```
/usr/bin/node ./index.js  
5
```

```
const user = {  
  name: "John",  
  age: 25,  
};  
  
function updateAge(u) {  
  u.age = 30;  
}  
  
updateAge(user);  
console.log(user.age);
```

```
/usr/bin/node ./index.js  
30
```

User is an object. In updateAge function the reference of an object is passed not a copy so original data gets affected. Age attribute is changed to 30

Note : If we want to pass copy of object we can use spread operator(...user)

```
<button id="btn">Click</button>
```

```
<script>
```

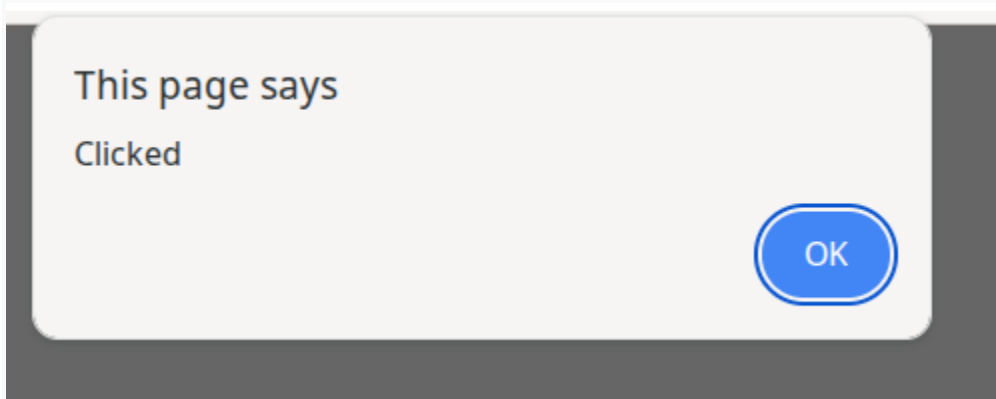

```
  const btn = document.getElementById("btn");
```

```
  btn.addEventListener("click", handleClick());
```

```
  function handleClick() {
```

```
    alert("Clicked");
```

```
  }</script>
```

handleClick() is executed as soon as page loads. In addEventListener handleClick() function is passed not a result. It requires only the function name.

Bug Fixed

```
btn.addEventListener("click", handleClick);
```

Now function runs only after button is clicked

```
fetch("https://api.example.com/data")  
  
  .then((res) => {  
    res.json();  
  })  
  
  .then((data) => {  
    console.log(data);  
  });
```

fetch requests data from the server. The first then receives the response.

res.json() is called, but not returned. Because nothing is returned, the next then gets undefined. console.log(data) prints undefined.

Bug Fixed

```
fetch("https://api.example.com/data")  
  
  .then((res) => res.json())  
  
  .then((data) => {  
    console.log(data);  
  });
```

res.json() is returned The next step receives the parsed data So data contains the actual response

```
const nums = [1, 2, 3, 4];

const result = nums.map(n => {

  if (n % 2 === 0) {

    return n * 2;

  }

});

console.log(result);
```

```
Console ... Filter (e.g. text, lexclude, \escape)
/bin/node ./index.js
[undefined, 4, undefined, 8]
```

map() function runs once for each element in nums array. For every even number it return its square and every odd number will be returned by undefined

Bug fixed :

```
const nums = [1, 2, 3, 4];

const result = nums.map(n => {

  if (n % 2 === 0) {

    return n * 2;

  }

  return n

});
```

```
console.log(result);
```

A terminal window with a dark background. The title bar shows 'Console' and a filter input 'Filter (e.g. text, !exclude, \escape)'. The command prompt is '/usr/bin/node ./index.js'. The output is '[1, 4, 3, 8]' in blue text.

```
Console ... Filter (e.g. text, !exclude, \escape)
/usr/bin/node ./index.js
[1, 4, 3, 8]
```

```
const person = {
  name: "Amar",
  greet: () => {

    console.log("Hello " +this.name);

  },

};

person.greet();
```

A terminal window with a dark background. The title bar shows '/usr/bin/node' and a filter input 'Filter (e.g. text, !exclude, \escape)'. The command prompt is './index.js'. The output is 'Hello undefined' in blue text.

```
/usr/bin/node ./index.js
Hello undefined
```

greet is written using an arrow function. Arrow functions do not get their own this. this.name does not refer to person. So this.name is undefined. It prints: Hello undefined.

```
const person = {  
  name: "Amar",  
  greet() {  
    console.log("Hello " + this.name);  
  }  
};  
person.greet();
```
